

# WhiteWater Shoot the Chute Boat

Simplicity of maintenance and long lasting durability are the main benefits of an extensive re-engineering effort on this large and iconic boat.

## Unique Benefits and Features

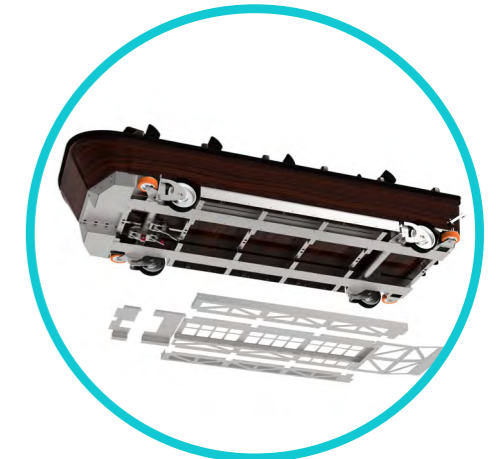

### LONGER LIFE AND EASIER TO MAINTAIN

The frame is composed of bent sheet metal versus large steel sections. This improves fatigue life and reduces the amount of welds requiring inspection. The removal of closed section steel in the frame prevents water from being trapped in hidden places, reducing corrosion potential. With open sections and bent sheet metal, the frame is now much easier to maintain and inspect.

### WATER DAMAGE PREVENTION

All wood coring in the fiberglass hull has been replaced with closed cell foam coring. This high strength material is resin-infused and will eliminate blistering from any water ingress.

### EASY ACCESS

The flotation foam is secured with 10 removable panels. The foam can be easily removed for replacement or for hull inspection.

### OPTIMAL LOAD DISTRIBUTION

The 4 wheel casters have been redesigned for better load distribution and fatigue life.

### PERFECT POSITION EVERY TIME

The hydraulic lap bar can lock in any position, as opposed to incremental positions, ensuring the best fit.
